– Troubleshooting & Support

1 Prerequisites

Before installing the ViaBill module, ensure the following:

Requirement	Details
PrestaShop version	1.7.3 or newer / 8.0.0 or newer
PHP version	As required by your PrestaShop version
ViaBill account	You can create one by completing the signup process at **portal.viabill.com/signup**
Backup	Always back up your site before installing modules

> **IMPORTANT**
> Always test modules on a staging environment before deploying to production.

2 Download the Module

The ViaBill module is available from the GitHub repository.

1. Go to **github.com/ViaBill-Integrations/ViaBill-PrestaShop-1.7**
2. Click the green **Code** button and select **Download ZIP**.
3. Extract the ZIP file on your computer. Locate the **viabill** folder inside.

4 Create a new ZIP file containing **only** the **viabill** folder. Name it **viabill.zip**.

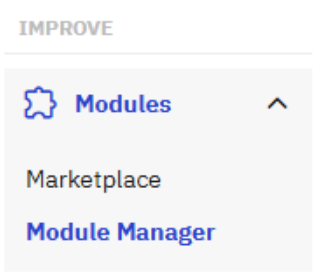

> **TIP**
> The ZIP file you upload must contain a folder named “viabill” at the root level. Do not upload the full repository ZIP directly.

3 Install the Module

Upload the module through the PrestaShop back office.

1 Log in to your PrestaShop back office.

2 Navigate to **Modules** → **Module Manager**.

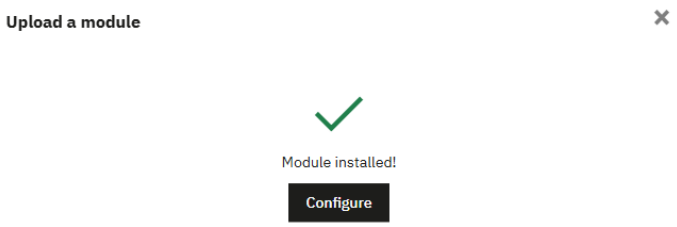

The Modules menu in the PrestaShop back office

3 Click the **Upload a module** button.

4 Select the **viabill.zip** file you prepared and confirm the upload.

5 Once uploaded, click **Install** to complete the installation.

Upload dialog confirming the module was installed successfully

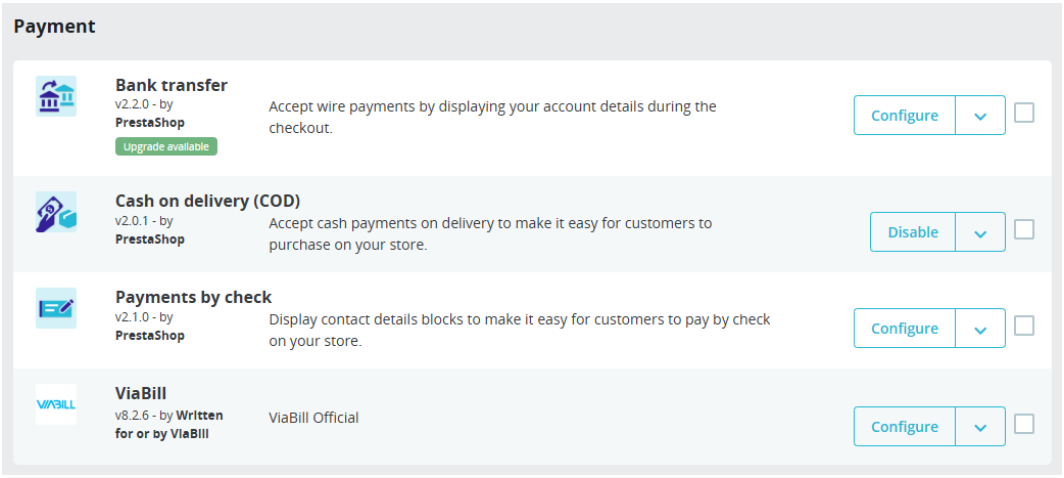

4 Connect Your ViaBill Account

After installation, configure the module by entering your ViaBill account credentials. You can find these values in your ViaBill merchant account. If you don't have a ViaBill account yet, create one by completing the

signup process at **https://portal.viabill.com/signup**.

1 In **Modules** → **Module Manager**, find ViaBill under the **Payment** section.

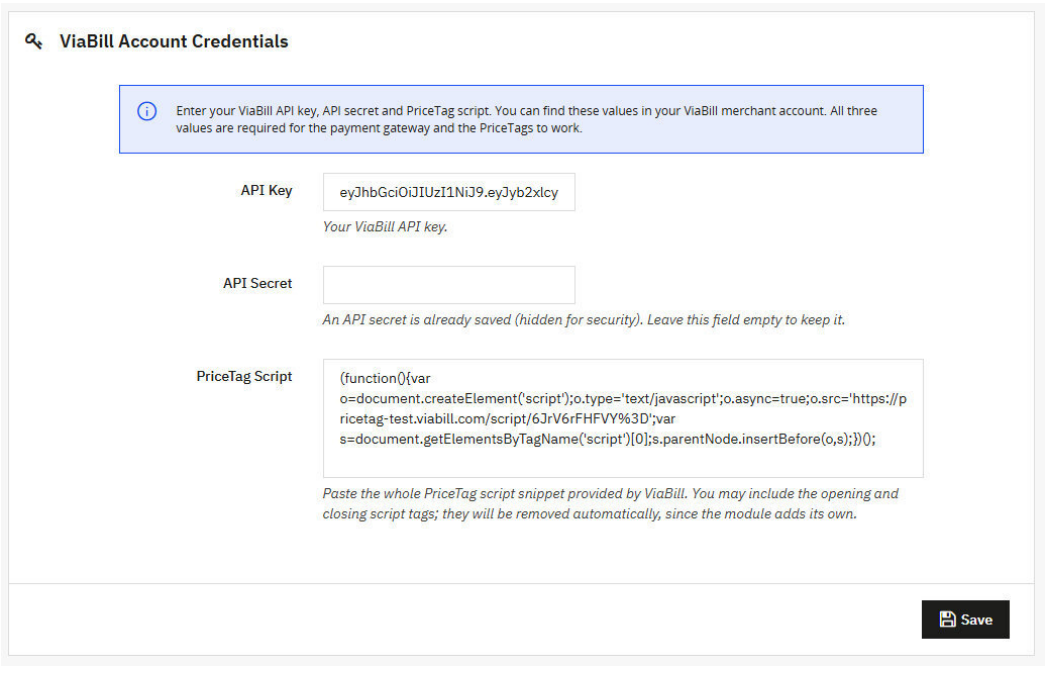

2 Click the **Configure** button.

ViaBill listed under the Payment section with its Configure button

3 Fill in the **ViaBill Account Credentials** form with the following values from your ViaBill merchant account:

- **API Key** – your ViaBill API key
- **API Secret** – your ViaBill API secret. If an API secret is already saved, it is hidden for security. Leave this field empty to keep it.
- **PriceTag Script** – paste the whole PriceTag script snippet provided by ViaBill. You may include the opening and closing script tags; they will be removed automatically, since the module adds its own.

The ViaBill Account Credentials form with the API Key, API Secret and PriceTag Script fields

4 Click **Save** to store your settings. All three values are required for the payment gateway and the PriceTags to work.

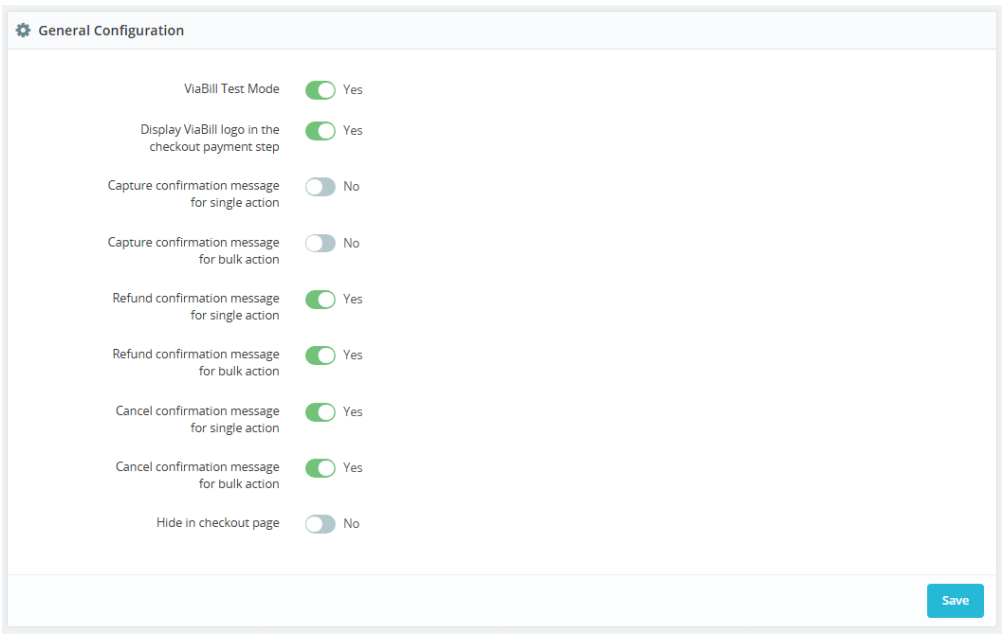

5 Configure the Module

Once your account credentials are saved, configure the module settings.

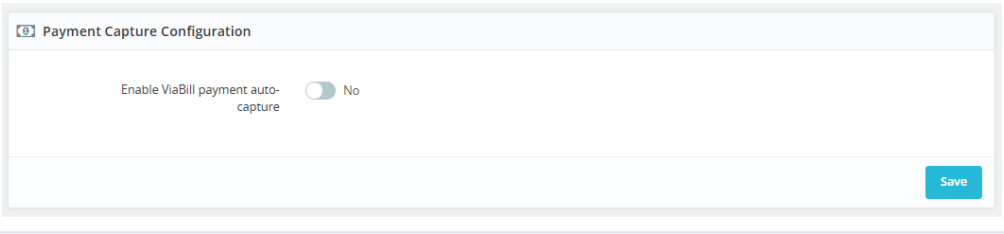

Setting	Recommended	Description
ViaBill Test Mode	–	Set to YES initially to verify the module is properly configured, then set to NO for live/production transactions.*
Various Messages	–	Choose whether or not you want message notifications sent on certain occasions.
Hide in checkout page	No	Useful only if a 3rd party payment module offers ViaBill payments and you want to use this module solely for PriceTag display.
Enable ViaBill payments auto-capture	–	Enable to auto-capture payments after authorization, instead of capturing them manually afterwards.
Order status after payment authorization	–	Set the order status after a payment authorization.
Order status after payment capture	–	Set the order status after a payment is captured.
Enable Try Before You Buy	–	Enable the ViaBill Try Before You Buy feature, allowing customers to try products before paying.

* Start with Test Mode = Yes to verify everything works, then switch to No for live transactions.

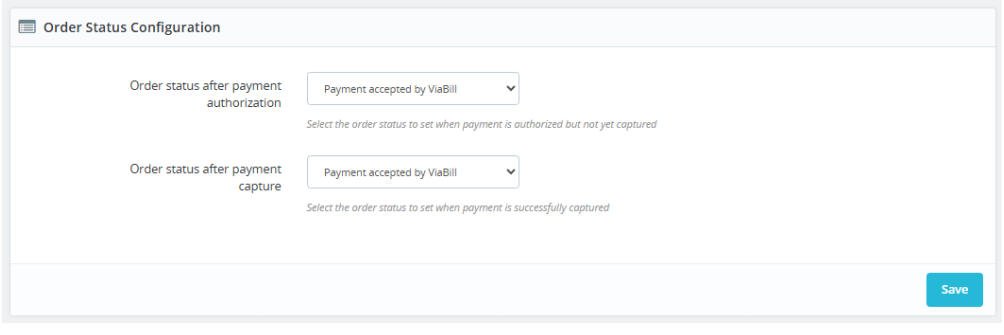

Click **Save** after making changes.

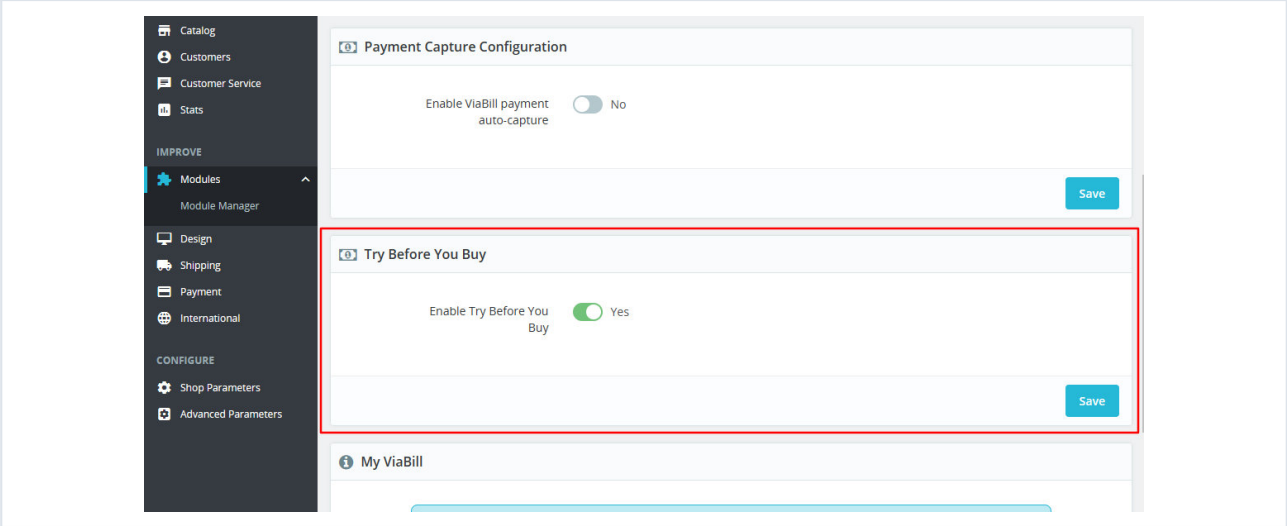

General Configuration – test mode, logo display, confirmation messages and checkout visibility

Payment Capture Configuration – the auto-capture setting

Order Status Configuration – statuses after authorization and capture

6 The ViaBill PriceTags

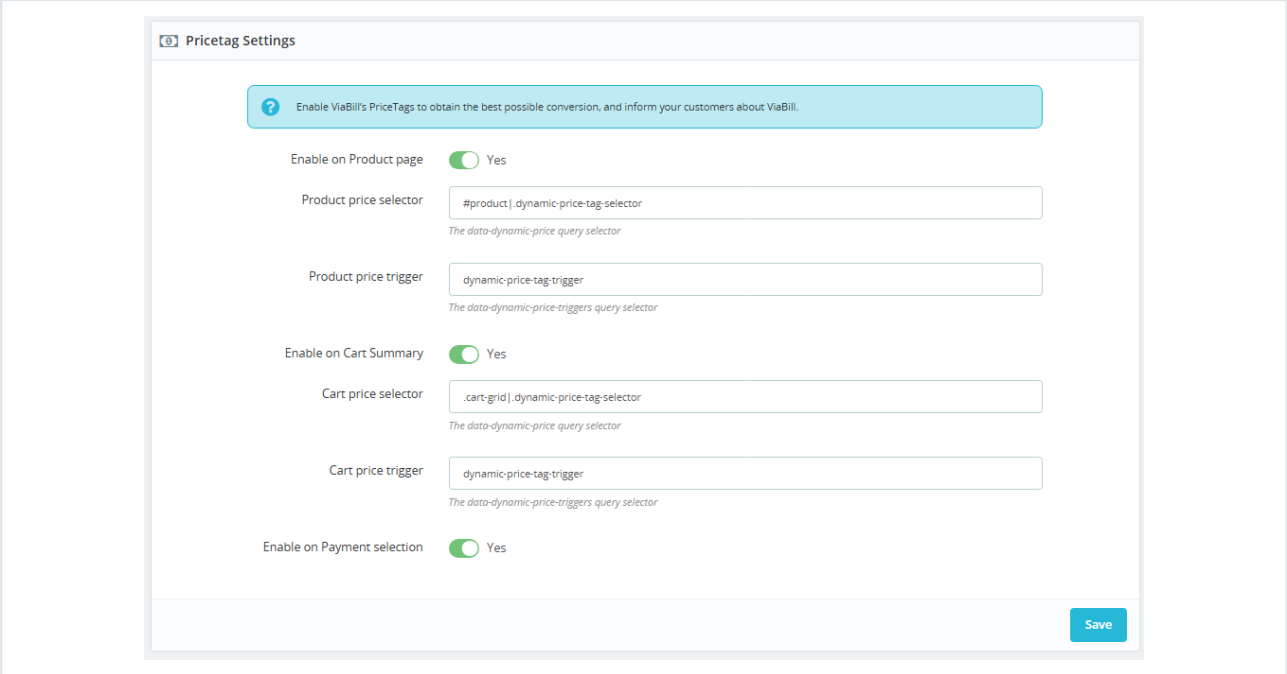

The PriceTag is a key conversion tool. It shows customers their estimated monthly payment directly on product pages, cart, and checkout – before they even select ViaBill as a payment method.

Benefits of enabling PriceTag:

- Increases average order value by making larger purchases feel affordable
- Improves conversion rate by removing price-related purchase hesitation
- Automatically calculates and displays the monthly installment amount
- Updates dynamically based on the product price or cart total

Setting	Recommended	Description
Enable on Product Page	–	Display the ViaBill PriceTag on single product pages. Use the Product Price Selector to override the display position (optional).
Enable on Cart Summary	–	Display the ViaBill PriceTag on the cart page. Use the Cart Price Selector to override the display position (optional).
Enable on Payment Selection	No	Display the ViaBill PriceTag on the checkout page.

Click **Save** after making changes.

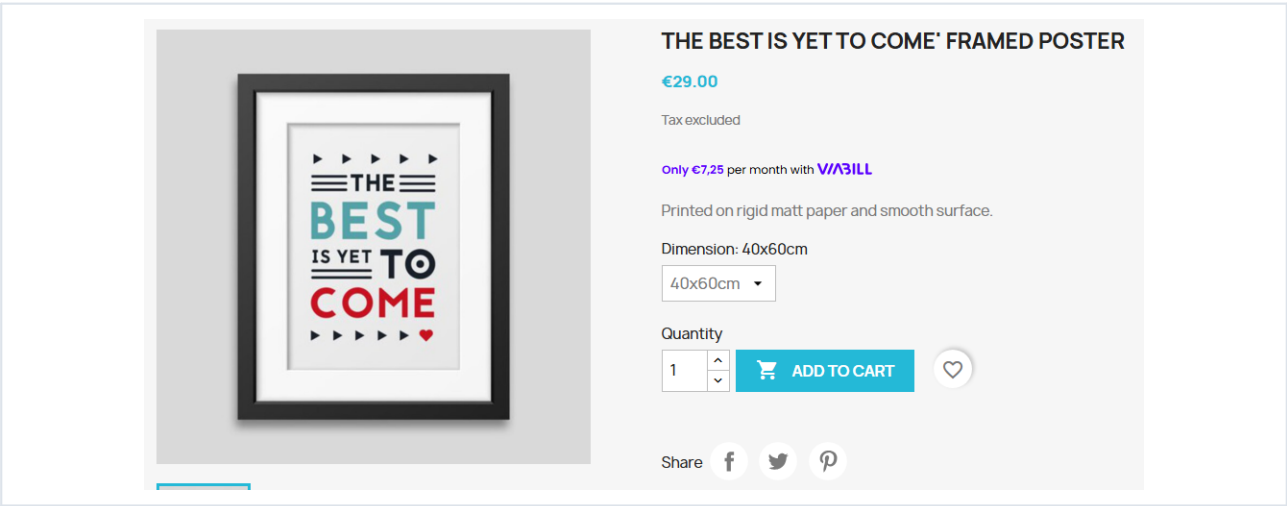

Pricetag Settings – enable locations and override the price selectors

7 Verify the Installation

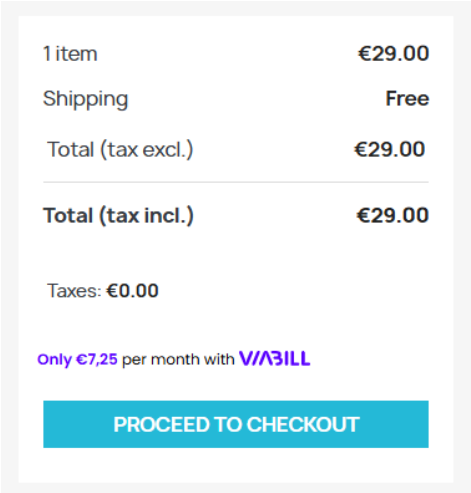

Confirm that ViaBill is working correctly in your store.

1. Open your storefront and navigate to a product page. Confirm the **ViaBill PriceTag** is visible.

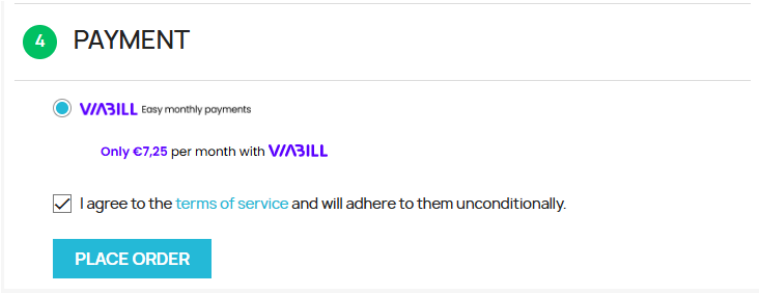

Product page showing the ViaBill PriceTag below the price

2. Add a product to your cart and verify the PriceTag appears on the **cart page**.

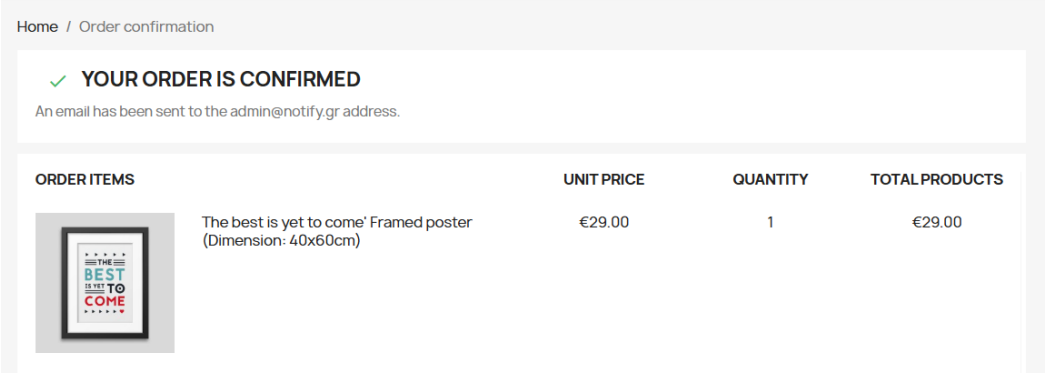

Cart summary showing the ViaBill PriceTag

3 Proceed to checkout and confirm **ViaBill** is listed as a payment method.

Checkout payment step with ViaBill listed as a payment method

4 Place a test order (with Test Mode enabled) to verify the complete flow.

Order confirmation for a completed test order

RECOMMENDATION

Enable PriceTag on all three locations (product, cart, checkout). Merchants who display PriceTag early in the customer journey see the highest uplift in conversion and average order value.

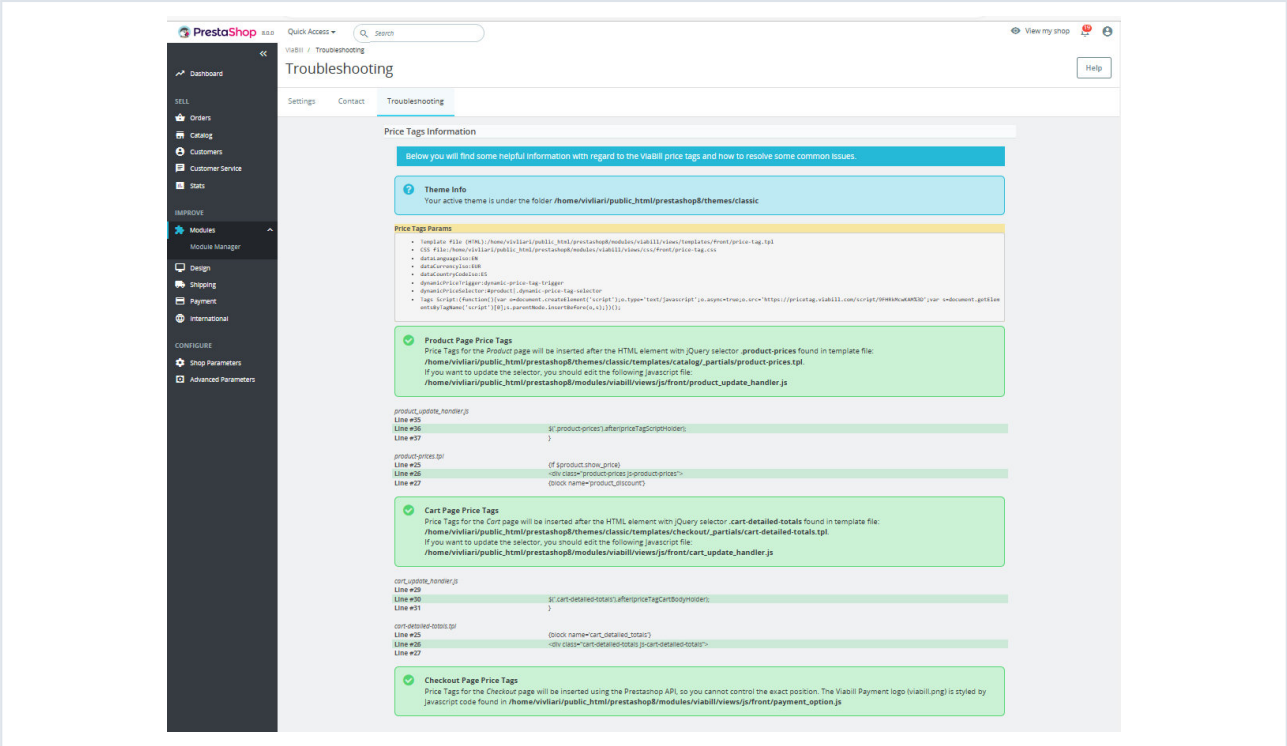

8 Updating the Module

To update the module manually:

1. Back up the folder: **{PrestaShop root}/modules/viabill**
2. Download the latest version from the GitHub repository.
3. Copy the new **viabill** folder contents into **{PrestaShop root}/modules/viabill**, overwriting existing files.
4. Clear the cache folder: **{PrestaShop root}/modules/viabill/var/cache** (keep index.php).
5. In the back office, go to **Modules** → **Module Manager** → **ViaBill** and click **Upgrade**.

Troubleshooting & Support

The module includes a built-in **Troubleshooting** tab with detailed PriceTag information for your active theme – template paths, query selectors and the JavaScript files to edit if you need to adjust where PriceTags are inserted on the product, cart and checkout pages.

The Troubleshooting tab with PriceTag information for the active theme

Issue	Solution
Module not appearing in Payment	Verify the ZIP file contains a “viabill” folder at root level. Re-upload if needed.

Issue	Solution
Configure button not showing	Clear PrestaShop cache via Advanced Parameters → Performance → Clear cache.
PriceTag not showing	Check PriceTag is enabled in the module configuration. Clear browser and PrestaShop cache.
Orders not processing	Ensure Test Mode is disabled for live transactions. Enable Debug Mode and check logs.
Upgrade button not appearing	Verify you copied files to the correct folder and the new version number is higher.
